Q1) Which of the following statements is true about high-level programming languages?

- A. They are difficult for humans to read and write.
- B. They are closer to human language, making them easier to understand.
- C. They do not require a compiler for execution.
- D. They are always slower than machine language.

Q2) What is the primary function of a compiler?

- A. To execute programs written in machine language.
- B. To translate a high-level language program into machine language.
- C. To compile a list of programming errors.
- D. To provide a graphical interface for coding.

Q3) What is the first step in executing a C++ program?

- A. Preprocessing
- B. Compilation
- C. Creating the source program
- D. Linking

Q4) In which step are the preprocessor directives handled?

- A. Creating the source program
- B. Preprocessing
- C. Compilation
- D. Linking

Q5) What is the purpose of the linking step in executing a C++ program?

- A. To check for syntax errors in the source code.
- B. To convert source code into object code.
- C. To combine object code with other programs to create executable code.
- D. To execute the program.

Q6) What happens during the loading step of executing a C++ program?

- A. The compiler checks for syntax errors and translates the code.
- B. The linker combines object code with other programs.
- C. The loader places the executable code into main memory.
- D. The preprocessor handles directives that start with #.

Answer key:

Q1)B

Q2)B
