

Test bank for ch 7

A prolonged decline in growth phase in a closed system results from:

- a. the toxic waste that will kill the weak cells, leaving the strong ones.
- b. the new media that is pumped through the culture.
- c. the decrease in pH that will kill most of the organisms and only leave stronger ones.
- d. nutrients released from dead cells that can be consumed by live cells.

A culture in a closed vessel to which no additional medium is added and from which no waste products are removed is called:

- a. fed-batch culture
- b. semicontinuous culture
- c. batch culture
- d. continuous culture

Which of the following procedures uses a photocell to measure absorbance of a culture to regulate the flow of culture media?

- a. Turbidostat
- b. Petroff-Hausser chamber
- c. Coulter counter
- d. Chemostat

All the following methods are used for estimation of viable bacterial cells except:

- a. membrane filter method

- b. spread plate technique
- c. biomass determination
- d. pour plate technique

During which phase are microorganisms most nearly uniform in terms of chemical and physiological properties?

- a. decline
- b. exponential
- c. lag
- d. stationary

An open system in which the growth rate is maintained by the removal and addition of media at such a rate as to maintain a constant cell density is called a:

- a. manostat.
- b. culturostat.
- c. turbidostat.
- d. chemostat.

Which of these methods can be used to determine the number of viable microorganisms in a sample?

- a. counting a known volume of cells in a hemocytometer
- b. light scattering in a spectrophotometer
- c. measuring colony-forming units per ml
- d. measuring total cell mass

Eosin methylene blue media supports the growth of:

- a. both gram-positive and gram-negative
- b. gram-negative
- c. only supports Archaea
- d. gram-positive

Addition of salt to a culture medium only allows the salt-tolerant bacteria to grow. This is an example of a:

- a. Enriched media
- b. Complex media
- c. Selective media
- d. Differential media
